INTERNSHIP PRESENTATION

Cybersecurity in Action:

Investigating a Digital Security Incident

A hands-on look at how cybersecurity analysts detect, investigate, and respond to threats

STUDENT NAME	ANUJ
ROLL NUMBER	2410031262
COLLEGE	IILM University, Greater Noida
ORGANIZATION	Deloitte — (via Forage Job Simulation)

What This Presentation Covers

This presentation summarises my experience completing the Deloitte Cyber Job Simulation on Forage — from understanding the scenario to the skills it helped me build.

About the Organisation

Who Deloitte and Forage are, and how they work together.

Internship Overview

What the Cyber Job Simulation involved and how it was structured.

Tasks Completed

The investigation-style tasks I worked through.

Skills Gained

Technical and analytical skills I practiced.

Key Learnings

What the experience taught me about cybersecurity work.

Conclusion

A summary of the overall takeaway.

Deloitte & Forage

Deloitte

One of the world's largest professional services networks, providing audit, consulting, risk advisory, and cybersecurity services to organisations across the globe.

Deloitte Cyber

Deloitte's cybersecurity practice helps organisations identify vulnerabilities, investigate incidents, and build resilient digital defences.

Forage

A global virtual work-experience platform offering employer-designed, self-paced job simulations. This experience is a simulation, not employment at Deloitte.

Together, Deloitte and Forage give students a realistic, risk-free preview of professional cybersecurity work.

The Cyber Job Simulation

A self-paced, practical simulation designed to reflect the type of work a Deloitte cybersecurity analyst does.

PROGRAM

Cyber Job Simulation

ORGANIZATION

Deloitte (via Forage)

FORMAT

Self-paced, guided by pre-recorded videos & example answers

FOCUS AREA

Cyber security — incident investigation

COMPLETED

August 2026

The Scenario

A client organisation reports that private company information may have leaked. As a cybersecurity analyst, the task is to review web-activity log data, look for unusual patterns, and determine whether the activity points to an internal or external source.

This is the general scenario used in the simulation, illustrating the type of investigation performed.

How the Investigation Was Carried Out

The simulation walks through an investigator's workflow, one step at a time.

01

Understand the Incident

Review the reported issue — a possible leak of private company information — and define what needs to be found.

02

Examine the Log Data

Study example web-activity log entries to observe user actions, timestamps, and IP addresses.

03

Spot Unusual Patterns

Identify repeated or abnormal activity that stands out from normal usage patterns.

04

Assess Internal vs External

Use clues such as IP address ranges to judge whether the activity originated inside or outside the network.

05

Document the Findings

Answer guided questions and summarise evidence to support a clear conclusion.

Skills and Knowledge Gained

TECHNICAL SKILLS

Log File Analysis

Reading and interpreting web-activity logs to trace user actions.

Network Fundamentals

Understanding IP addresses, internal vs external traffic, and basic network security concepts.

Threat Identification

Recognising suspicious or abnormal patterns of activity.

PROFESSIONAL SKILLS

Technical Documentation

Clearly recording evidence and conclusions from an investigation.

Analytical Thinking

Approaching a problem methodically, from evidence to conclusion.

Attention to Detail

Carefully reviewing data to avoid missing key clues.

"Effective cybersecurity requires both technical skills and analytical thinking."

Key Learnings and Outcomes

A simple framework for thinking through any security investigation.

1

What Happened?

Identify the observable facts — what the logs actually show.

2

Why Does It Matter?

Connect the evidence to the business impact — what risk it represents.

3

What Should Be Done?

Recommend a clear next step or response based on the findings.

This simulation strengthened my understanding of how log analysis, pattern recognition, and clear reporting come together in real cybersecurity work.

Challenges Faced and How I Solved Them

CHALLENGE

Interpreting raw log data

SOLUTION

Reviewed each log entry carefully and cross-checked timestamps and IP patterns before drawing conclusions.

CHALLENGE

Limited prior networking knowledge

SOLUTION

Used the guided videos and example answers provided in the simulation to build understanding step by step.

CHALLENGE

Distinguishing normal vs suspicious activity

SOLUTION

Compared activity against expected usage patterns to judge what looked unusual.

Bringing It All Together

"Good cybersecurity work starts with careful observation and ends with a clear, actionable conclusion."

Think like an investigator — start from evidence, not assumptions.

Basic networking concepts are essential to spotting real threats.

Clear documentation is as important as the technical finding itself.

This experience gave me a practical foundation for exploring cybersecurity further.

THANK YOU

Thank You

Questions and feedback are welcome.
